The 14.3-inch Retina display sports a resolution of 2304-by-1480 pixels, making it the highest resolution among the MacBook Pro lineup. USB-C ports can charge the device, and a side-mounted Ethernet port means that users can always have an Internet connection, whether they're working on the go or tethered to a desk. Ezdrummer 2 Keygen Serial Key is the best tool for all.Q: Converting a cell array of strings to a cell array of integers I want to convert a cell array of strings to a cell array of integers (or, in general, convert a vector of strings to a vector of any numeric type). I looked at the ConvertArrays utility function but that does not work for my situation. Here's an example of what I'm working with: >> a = 'dog cat apple'; a = dog cat apple >> cellfun(@str2num, a) ans = 1 3 3 The str2num is throwing off the result. My question is: how can I do this conversion? A: Try str2double >> str2double(a) 1 The problem is that str2double considers that the string is a concatenation of characters. It tries to find where the string ends and starts again. But since it does not find any end, it returns an incorrect result. This is not a problem with cellfun because it uses str2double internally anyway. It only expects numbers as strings. import {arrayDifference} from '../src/utills'; const answers = [{ id: '1', title: 'How to calculate the area of a triangle', question: 'What is the 82157476af
